Live Product Walkthrough & Audience Engagement Guide

Objective: Conducting a High-Conviction, Interactive Live Demonstration on Zoom / In-Person | **Presenter:** P. S. Surya Teja

1. The Psychology of Pitching Technical Interviewers

Technical interviewers and engineering managers do not want a passive slide deck. They want to see a **live, responsive system**, understand how state mutates, and verify that you understand real-world edge cases. Follow these 3 rules:

- **Rule 1: Hook with the Metric:** Open with $69,565 audited in 76.7ms and $26,660 fraud prevented.
- **Rule 2: Don't Just Talk, Mutate:** Move the tolerance slider live on screen. Interviewers love seeing state mutate across the app without page reloads.
- **Rule 3: Frame Anomaly Detection as Business Value:** When showing Scenario 6, emphasize that stopping a $10,000 BEC wire fraud saves the company 10x the annual cost of the software.

2. The 7-Phase Live Demonstration Flow

Phase 1: Setting the Executive Baseline (AP Command Dashboard)

Live Screen Action: Land on AP Command Dashboard. Point to 5 KPI cards. Point to the Two-Tier header.

> *"Let's start on the AP Command Dashboard. You can see we have audited $69,565 across 6 commercial invoices in 76.7ms mean latency. 33.3% cleared autonomously, while $26,660 in fraud, duplicate, and arithmetic errors were quarantined at the gate."*

Phase 2: The Interactive Aha! Moment (Tolerance Sensitivity)

Live Screen Action: Scroll down to Dynamic Corporate Tolerance Workbench. Move slider from 3% to 0%, then back to 3%.

> *"Watch how corporate tolerance operates dynamically. Our dual-threshold policy enforces 3.0% and $250 ceilings. When I tighten this slider to Zero Tolerance, notice how the STP rate immediately drops to 16.7% in memory: Scenario 2 (with a $185 courier freight) is instantly quarantined. Sliding back to 3% restores autonomous approval without any database reload."*

Phase 3: The Deep Forensic Reconciler (Live Execution Studio)

Live Screen Action: Click 'Live Execution Studio'. Scenario 1 is loaded. Point out Left Pane extraction and Right Pane 3-Way Match.

> *"Now let's look under the hood in the Live Execution Studio. On the left is our multimodal extraction showing 99.2% confidence. On the right is our Industrial 3-Way Match: comparing contracted PO-2026-101, Warehouse Receiving Dock GRN-881, and the billed commercial invoice. In Scenario 1, the invoice states $12,960 gross, but Node 5 separates the 8% embedded sales tax ($960) to reconcile net-to-net with exactly $0 variance."*

Phase 4: Threat Simulation — Catching BEC Wire Fraud

Live Screen Action: Select Scenario 6 (Kinetic Studio). Click Node 2. Highlight red alert banner: unverified *7749 != master *9910.

> *"Now observe our defense against Business Email Compromise in Scenario 6. The math is valid and PO-2026-204 is active. However, Node 2 detects that the remit bank account in the footer is *7749, whereas our verified ERP record specifies *9910. The engine triggers an immediate hard halt, locking the $10,000 disbursement before money leaves treasury."*

Phase 5: Closed-Loop Dispatch & NetSuite GL Mutation

Live Screen Action: Return to Scenario 1. Click [Post NetSuite GL Voucher & Disburse]. Show the modal popup.

> *"This isn't a mock dashboard—it's a closed-loop system. When I click 'Post NetSuite GL Voucher', the engine synthesizes a balanced double-entry journal entry—debiting Software Hardware Expense and Prepaid Tax while crediting Accounts Payable—complete with a cryptographic SHA-256 SOX audit hash and Fedwire wire ID."*

Phase 6: The 2-Column Forensic Bento Registry

Live Screen Action: Click '6 Scenario Payloads' in navbar. Show 2-column bento grid. Click '{ } Raw JSON' on Card 1.

> *"In our 6 Scenario Payloads tab, we built a 2-column forensic bento grid. Each card features a 4-metric financial strip and a 6-node micro-pipeline status strip. Clicking '{ } Raw JSON' expands the exact syntax-highlighted OCR payload evaluated by our engine."*

Phase 7: The Zero-Overlay Self-Driving Guided Tour

Live Screen Action: Click '■ Interactive Tour' in header. Let it run for 15 seconds. Point out zero blur/dark overlay.

> *"Finally, for executive reviewers, I built a zero-overlay Guided Product Tour. Notice how the page remains 100% crisp and unblurred: our virtual AI Guide glides across the viewport, the Tier 2 navbar pulses to indicate page shifts, and live actions execute automatically."*

3. Interactive Prompts to Involve the Interviewer

- *"Would you like me to inject a custom edge case using our Interviewer Chaos Builder, such as a 25% price drift or a missing PO?"*
- *"Would you like to see how the engine handles a fuzzy duplicate suffix like INV-2026-8821-R submitted 3 days after payment?"*
- *"Shall we dive into the Python source code for Node 5 (Dual-Gate Tolerance) or inspect the SQLite schema?"*
