ZAMP AP-AUTONOMOUS-WORKFORCE

Turnkey Video Recording Demo Script & Screen Walkthrough

Target Length: 4:30 – 5:15 Minutes | **Format:** 1080p Full-Screen Screencast (Loom / YouTube) | **Presenter:** P. S. Surya Teja (AI Solutions Architect)

---

1. Pre-Recording Technical Checklist

Before hitting record, ensure your local environment is pristine:

- **Server URL:** Open Google Chrome / Brave to http://localhost:5000 in full screen (F11 or maximized window).
- **Reset State:** Click the Reset ERP button in the top navbar once so all 6 scenarios and PO budgets are at master seed state.
- **Audio Setup:** Use a dedicated external mic. Speak with confident, authoritative executive cadence (like a Senior Director of AI Solutions at Ramp / Stripe).
- **Cursor Visibility:** Set your screen recorder to show a high-contrast mouse pointer or subtle click-glow.

2. Minute-by-Minute Narration & Action Walkthrough

[0:00 – 0:35] Act 0: The Executive Hook & Problem Statement

Visual Cue & Action: Browser resting on the AP Command Dashboard (http://localhost:5000). Hover cursor near Zamp Monogram.

> *"Hi everyone, I'm **P. S. Surya Teja**, and this is the **Zamp Autonomous AP Workforce Platform** built for Problem Statement 1.*
>
> *In corporate finance, manual Accounts Payable is a critical operational liability: the average enterprise spends **4.2 days** per invoice, suffers a **3.8% error rate**, and loses millions to **Business Email Compromise (BEC) wire fraud** and duplicate billings.*
>
> *Instead of relying on naive, non-deterministic LLM prompts that hallucinate arithmetic and fail SOX 404 audit compliance, I engineered an **Institutional FinTech Reconciler**. It pairs multimodal document extraction with a **deterministic 6-Node Financial Validation Gate Pipeline**, achieving **sub-100ms latency**, **33.3% autonomous straight-through processing (STP)**, and **100% cryptographic auditability**."*

[0:35 – 1:15] Act 1: Two-Tier Command Header & ■K Command Palette

Visual Cue & Action: Hover across the top header. Point out the live pulse pill. Press ■K (or Ctrl+K), filter for 'Scenario 6', then hit ESC.

> *"To deliver a top-tier institutional fintech feel inspired by Stripe and Ramp, the interface uses a **Strict Zero-Wrap Two-Tier Command Header**.*
>
> *Tier 1 houses our global utilities: brand monogram, live operational protocol heartbeat, and quick jump triggers. Pressing **■K** opens our keyboard-first Command Palette, allowing finance controllers to instantly navigate between workspaces, specific test scenarios, or corporate tolerance presets in milliseconds.*
>
> *Tier 2 houses our **5 Primary Workspaces** alongside a live financial telemetry ticker tracking mean pipeline latency (**76.7ms**), autonomous STP clearance, and SOX 404 compliance."*

[1:15 – 2:05] Act 2: AP Command Dashboard & Dynamic Tolerance Sensitivity

Visual Cue & Action: Point to 5 KPI cards. Scroll to Tolerance Workbench. Click 'Zero Tolerance (0%)' — watch Scenario 2 quarantine live. Click 'Standard Corporate (3%)' — watch it auto-approve. Scroll to Ledger, filter by Quarantined then All.

> *"On the **AP Command Dashboard**, finance leaders gain instant operational visibility. Across our commercial dataset of $69,565, the autonomous engine cleared valid spend while quarantining **$26,660 in fraud, duplicate, and arithmetic threats**.*
>
> *Now observe our **Dynamic Corporate Tolerance Workbench**: enterprise policies enforce dual thresholds—a percentage ceiling Δ% and an absolute dollar ceiling Δ$.*
>
> *Watch what happens when I switch to **Zero Tolerance (0% / $0)**: instantly in memory, the engine re-evaluates all 6 invoices without a page reload. Scenario 2—which carries a legitimate $185 courier freight charge—is immediately quarantined. When I restore Standard Corporate (3% / $250), it straight-through clears.*
>
> *Down below, our **Master AP Processing Ledger** categorizes every finding by its deterministic root-cause vector—whether it is BEC wire diversion, fuzzy suffix collisions, or unit price drift."*

[2:05 – 3:10] Act 3: Live Execution Studio & Industrial 3-Way Match

Visual Cue & Action: Click 'Live Execution Studio' in navbar. Scenario 1 loads. Point out Left Pane extraction (99.2%) & Right Pane 3-Way Match card. Click Node 5. Switch to Scenario 6, show Node 2 BEC wire alert (*7749 != *9910). Return to Scenario 1, click [Post NetSuite GL Voucher].

> *"Stepping into our **Live Execution Studio**, we see a split-screen reconciler bridging document extraction with ERP truth.*
>
> *On the left, our multimodal parser extracts document tokens with **99.2% confidence**. On the right, we execute an **Industrial 3-Way Match**: reconciling Contracted PO-2026-101, Warehouse Receiving Dock GRN-2026-881, and billed invoice line items with 100% quantity and rate parity.*
>
> *Notice how the engine handles taxes in Scenario 1: instead of naively comparing the $12,960 gross amount to the $12,000 PO, **Node 5** backs out the 8% embedded sales tax ($960) to reconcile net-to-net at exactly 0.0% variance.*
>
> *Now, look at **Scenario 6**: the math is valid and the PO exists, but the footer wire remittance directs funds to account ***7749** instead of verified ***9910**. **Node 2** triggers an immediate hard quarantine—locking payment before funds leave treasury.*
>
> *Finally, this is a closed-loop system: clicking Post NetSuite GL Voucher generates a balanced double-entry journal entry with a cryptographic SHA-256 audit hash."*

[3:10 – 3:55] Act 4 & 5: 6-Gate Matrix & 6 Scenario Bento Registry

Visual Cue & Action: Click '6-Gate Matrix', scroll across the 6 gates. Then click '6 Scenario Payloads'. Show the 2-column bento grid, 4-metric strip, 6-gate dots, and click '{ } Raw JSON' on Card 1.

> *"In the **6-Gate Matrix**, controllers inspect the sub-120ms sequential pipeline: Math Integrity → Duplicate & BEC Fraud → PO Resolution → Line Rates → Tolerance → Action Dispatch.*
>
> *Next, our **6 Scenario Payloads Registry** features a high-density 2-column forensic bento grid. Each card presents a 4-metric financial strip and a 6-node micro-pipeline status strip. Clicking **{ } Raw JSON** expands the syntax-highlighted OCR payload directly on the card."*

[3:55 – 4:40] Act 6: Zero-Overlay Self-Driving Guided Product Tour

Visual Cue & Action: Click '■ Interactive Tour' in header. Highlight that the page remains 100% unblurred and bright. Watch the virtual beacon glide and navbar active tab pulse in emerald. Step through 2 steps, then hit ESC.

> *"To make reviewing effortless, I built an **Interactive Guided Tour Engine**.*
>
> *Notice the clean presentation: there are **zero full-screen dark or blurry overlays** washing out the website. We use **Positive Visual Elevation** to spotlight components while keeping the two-tier navbar and canvas 100% crisp. As we step through, our virtual AI Guide glides across the viewport, the Tier 2 navbar visibly pulses, and state mutations execute hands-free."*

[4:40 – 5:10] Act 7: Intake & Chaos Studio + Executive Closing

Visual Cue & Action: Click '✦ Intake & Chaos Studio', show PDF uploads and Interviewer Chaos Builder, close modal, and look at camera for closing.

> *"Finally, with our **Intake & Chaos Studio**, interviewers can upload real invoice PDFs or inject custom overcharges and wire diversions on the fly.*
>
> *By combining deterministic multi-gate verification with an institutional design system, this platform proves that enterprise AP automation must be **fast, mathematically provable, and fraud-immune**.*
>
> *Thank you, and I look forward to our technical deep dive!"*
